By substituting the intersection of the plane of the point (2.0.3).so,

$$\Rightarrow \lambda = \frac{-2}{3} \quad (2.0.10)$$

\therefore By substituting $\lambda, n_1, n_2, c_1, c_2$ values in (2.0.9) we get required plane equation as,

$$(7 \quad -5 \quad 4)\mathbf{x} = 8 \quad (2.0.11)$$

Plot of the plane :

1 QUESTION No 2.39

Find the equation of the plane through the intersection of the planes $(3 \quad -1 \quad 2)\mathbf{x} = 4$ and $(1 \quad 1 \quad 1)\mathbf{x} = -2$ and the point $\begin{pmatrix} 2 \\ 2 \\ 1 \end{pmatrix}$.

2 SOLUTION

Given,

$$(3 \quad -1 \quad 2)\mathbf{x} = 4 \quad (2.0.1)$$

$$(1 \quad 1 \quad 1)\mathbf{x} = -2 \quad (2.0.2)$$

$$\mathbf{A} = \begin{pmatrix} 2 \\ 2 \\ 1 \end{pmatrix} \quad (2.0.3)$$

Equation can be written as,

$$\mathbf{n}_1^T \mathbf{x} = c_1 \quad (2.0.4)$$

$$\mathbf{n}_2^T \mathbf{x} = c_2 \quad (2.0.5)$$

Where,

$$\mathbf{n}_1 = \begin{pmatrix} 3 \\ -1 \\ 2 \end{pmatrix}, \mathbf{n}_2 = \begin{pmatrix} 1 \\ 1 \\ 1 \end{pmatrix} \quad (2.0.6)$$

$$c_1 = 4, c_2 = -2 \quad (2.0.7)$$

Required equation of the plane containing (2.0.4) and (2.0.5) is,

$$\mathbf{n}_1^T \mathbf{x} + \lambda \mathbf{n}_2^T \mathbf{x} = c_1 + \lambda c_2 \quad (2.0.8)$$

$$\Rightarrow (\mathbf{n}_1^T + \lambda \mathbf{n}_2^T) \mathbf{x} = c_1 + \lambda c_2 \quad (2.0.9)$$

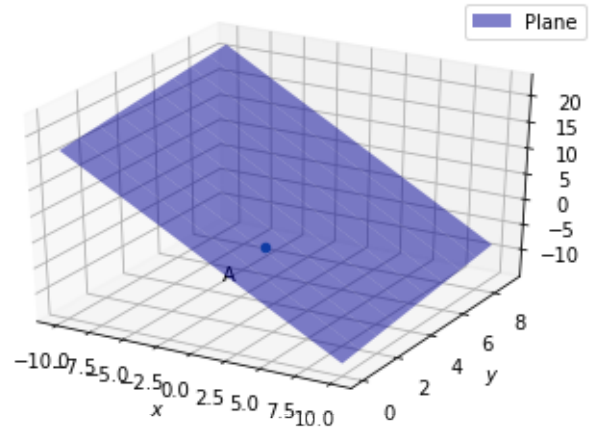

Fig. 2.1: Plot of the plane
